

beAlve vitals report

INDICATOR	RESULT	DESIRED RESULT	EXPLANATION
Risks			
High Blood Pressure Risk	-	Low	The High Blood Pressure Risk result indicates whether your blood pressure exceeds preset systolic/diastolic values. Possible results: Low, Medium, or High. Higher results indicate that your blood pressure is above the preset thresholds.
High Hemoglobin A1c Risk**	-	Low	The High Hemoglobin A1c Risk (HbA1c) result indicates whether your Hemoglobin A1c level exceeds a preset threshold. Possible results: Low, Medium, or High. Higher results indicate that Hemoglobin A1c levels are above the preset threshold.
High Fasting Glucose Risk**	-	Low	If you did not fast for 8-12 hours before taking a measurement, please disregard these results. The High Fasting Glucose Risk result indicates whether your glucose level exceeds a preset threshold after at least 8 hours of fasting. Possible results: Low or High. A high result indicates that your fasting glucose level is above the preset threshold.
High Total Cholesterol Risk**	-	Low	The High Total Cholesterol Risk result indicates whether your cholesterol level exceeds a preset threshold. Possible results: Low, Medium, or High. A higher result indicates that your total cholesterol level is above the preset thresholds.
Low Hemoglobin Risk**	—	Low	The Low Hemoglobin Risk result indicates whether the Hemoglobin level drops below a preset threshold. Possible results: Low or High. High result indicates that Hemoglobin falls below the preset threshold.
ASCVD Risk (%)	—%	Based on Framingham CVD model	ASCVD (Atherosclerotic Cardiovascular Disease) Risk estimates the likelihood of experiencing an atherosclerotic cardiovascular event within 10 years.

INDICATOR	RESULT	DESIRED RESULT	EXPLANATION
Heart Age (years)	— years	Based on Framingham Heart Age model	The Framingham Heart Age estimates the biological age of the heart based on risk factors and comparing it to an ideal healthy profile.
Basic Vital Signs			
Wellness Score	—	More than 6	The beAlve Wellness Score is meant to predict your cardiovascular risk for the next 5 to 10 years, based only on the measured vitals.
Wellness Level	—	Normal	Overall Wellness Level.
Blood Pressure (mmHg)	— mmHg	<129/90	Blood Pressure is the force of blood on artery walls. The first number (Systolic) measures the pressure when your heart beats. The second (Diastolic) indicates the pressure when your heart rests between beats.
Heart Rate (Beats/Minute)	— bpm	60-100	Normal resting heart rate is between 60-100 bpm. Heart rate is the number of times your heart beats per minute. This number fluctuates throughout the day.
Breathing Rate (Breaths/Minute)	— breaths/min	12-20	Adults normal breathing rate at rest ranges between 12-20 breaths per minute.
Oxygen Saturation (%)	—%	>95	Oxygen Saturation (SpO2) measures how much oxygen the red blood cells carry from the lungs to the rest of the body. Normal SpO2 for healthy lungs ranges between 95%-100%.
PRQ (Pulse-Respiration Quotient)	— ratio	~5	The PRQ reflects the efficiency with which the heart and lungs are working together.
Bloodless Blood Tests			
Hemoglobin A1c (%)**	—%	<5.7	Hemoglobin A1c shows your average blood sugar for 2-3 months. It helps detect pre-diabetes and diabetes.
Hemoglobin (g/dL)**	— g/dL	Male:14-18, Female:12-16	Hemoglobin distributes the oxygen you breathe to muscles and tissues throughout your body.

INDICATOR	RESULT	DESIRED RESULT	EXPLANATION
Stress			
Stress Level	-	Low and Normal	Your stress level (Baevsky Index) reflects how your body handles challenges.
Stress Index	—	<150	A non-negative number reflecting how your body handles challenges based on Baevsky Stress Index.
Normalized Stress Index (%)	—	<40	The Normalized Stress Level is calculated from the Stress Index and scaled to a range of 0 to 100. A high value indicates high stress.
Advanced Heart Rate Variability			
PNS Zone - Recovery Ability	-	Normal	The Recovery Ability that is also known as “rest and digest” response refers to the body’s ability to recover, accumulate energy, and regulate bodily functions after stressful occurrences. This is part of the autonomic system that consists of two sub-systems, the sympathetic (Stress Response) system and the parasympathetic (Recovery Ability) system. Your Heart Rate Variability is reflected in the balance between these two sub-systems.
PNS Index	—	—	Parasympathetic Nervous System Index.
SNS Zone - Stress Response (Fight or Flight)	-	Normal	The Stress Response, which is also known as “fight or flight” response, refers to a physiological reaction to imminent danger that occurs when we are scared, anxious, stressed, attacked, or threatened. Essentially, it prepares our body to either deal with a threat or to run for safety. This is part of the autonomic system that consists of two sub-systems, the sympathetic (Stress Response) system and the parasympathetic (recovery ability) system. Your Heart Rate Variability is reflected in the balance between those two sub-systems.
SNS Index	—	—	Sympathetic Nervous System Index.
Mean RRI	— ms	—	Mean RR Interval.

INDICATOR	RESULT	DESIRED RESULT	EXPLANATION
RMSSD	— ms	—	Root Mean Square of Successive Differences.
SDNN	— ms	—	Standard Deviation of NN intervals.
SD1	— ms	—	Poincare plot standard deviation perpendicular to the line of identity.
SD2	— ms	—	Poincare plot standard deviation along the line of identity.
LF/HF Ratio	— ratio	—	Ratio of Low Frequency to High Frequency power.
RRI	—	—	RR Intervals.

Notes:

- 1.The measured health indicators are for general wellness and fitness purposes only, not for medical diagnosis.
- 2.Confidence levels indicate the probability of measurement accuracy. Not all vitals have confidence levels yet.
- 3.Incomplete data may result in missing measurements. Follow instructions for proper face measurement or PPG sensor use.

****Disclaimer:** These indicators are still under research.
